

WHAT IS CLAIMED IS:

1. A cable connector comprising:

a cable and a wire extending from a center of an end of the cable;

a connector connected to the end of the cable and a semi-circular plate

5 extending from an end of the connector, two notches defined in an end surface of the connector and a groove defined in an inner periphery of the semi-circular plate, and

a hooking piece being pressed in the groove and two ends of the hooking piece extending perpendicularly beyond two longitudinal sides of the semi-circular plate.

10 2. The connector as claimed in claim 1, wherein the hooking piece has a circular cross section.

3. The connector as claimed in claim 1, wherein each of the two ends of the hooking piece has a bent portion which is formed by bending the hooking piece outward at a distance from a distal end of each of the two ends of the hooking piece,
15 a distance between two peaks of the two bent portions being longer than a distance between any two symmetric points on the hooking piece relative to a symmetric line of the hooking piece.
